

SROW Public Reference Benchmark Source (v0.1)

Chapter 1: Introduction to Structured Resolution-Oriented Writing

Structured Resolution-Oriented Writing (SROW) is a communication protocol for making structured knowledge readable and navigable.

Structure is a form of reader respect. Explicit structural hierarchy reduces cognitive friction for both human readers and automated systems.

Progressive disclosure is a staged presentation that exposes orientation and structure before deeper analytical explanation or granular detail.

Resolution levels range from L0 to L4: L0 provides orientation summaries, L1 states core principles, L2 articulates functional architecture, L3 details implementation, and L4 provides granular data.

Chapter 2: Technical Architecture, Stable Identity, and Data Model

The stable-ID algorithm uses SHA-256 truncated to 16 hexadecimal characters over the canonical lexically sorted source-block identifiers.

Structured Resolution-Oriented Writing (SROW) establishes explicit structural compliance for software and AI validation.

Explicit relationships link meaning units using typed predicates: `derives_from` indicates source lineage, `clarifies` provides architectural context, and `is_a` denotes specialization.

A conformant Machine Edition package comprises six core record types: `manifest`, `meaning_unit`, `definition`, `relationship`, `boundary`, and `provisional`.

Chapter 3: Semantic Resolution, Monotonicity, and Ambiguity Handling

Resolution monotonicity requires that higher detail levels preserve all invariants of lower detail levels without semantic contradiction.

Epistemic authority requires that every atomic assertion binds directly to verifiable cryptographic release hashes or canonical provenance.

When source evidence is underspecified or accommodates multiple valid interpretations, an agent must provide explicit qualifications and confidence levels.

Contextual scope tags define the operational domain of each assertion, separating universal core invariants from provisional or domain-specific assertions.

Chapter 4: Boundaries, Scope, and Epistemic Limitations

SROW is an expression and structuring protocol, not a cognition architecture or internal thought representation.

Structured records improve inspectability and retrieval precision; they do not guarantee factual truth or eliminate model error.

This public reference material contains only authorized public companion samples and does not include the complete manuscript or source code.

Schema conformance certifies structural and syntactic compliance; it does not constitute an epistemic endorsement of the truth or validity of the content.
