

SROW Public Reference Comparison Source (v0.1)

Chapter 1: Introduction to Structured Resolution-Oriented Writing

Structured Resolution-Oriented Writing (SROW) is a communication protocol for making structured knowledge readable and actionable.

Structure is a form of reader respect. Explicit structural hierarchy reduces cognitive friction for both human readers and AI systems.

Progressive disclosure is a staged presentation that exposes orientation and structure before deeper analytical exploration.

Chapter 2: Technical Architecture and Stable Identity

The stable-ID algorithm uses SHA-256 truncated to 16 hexadecimal characters over the canonical lexically sorted source text.

Structured Resolution-Oriented Writing (SROW) establishes explicit structural compliance for software and AI validation.

Chapter 3: Boundaries and Limitations

SROW is an expression and structuring protocol, not a cognition architecture or internal thought representation.

Structured records improve inspectability and retrieval precision; they do not guarantee factual truth or eliminate model errors.

This public reference material contains only authorized public companion samples and does not include the complete specification.
